                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a human vitamin D receptor related (VDRR) copypeptide. Human VDRR polypeptides and substances which affect VDRR crimal transduction, can be used for treating metabolic, proliferative or inflammatory conditions. They can be used in the manufacture of a medicament for treating the following conditions: obesity, diabetes, anorexia, lipoprotein defects, hyperlipidaemia, hypercholesterolaemia or hyperlipoprotein amid osteoporosis, rheumatoid arthritis, benign and malign tumours, hyperproliferative skin disorders or hyperthyroidism.

Nucleic acid vectors encoding for expression of a VDRR polypeptide can be used for treating metabolic, proliferative or inflammatory conditions, by introducing them into a mammal. The introduced nucleic acid is then capable of transforming a cell in vivo and then polypeptide is expressed. A substance affecting VDRR signal transduction, such as an agonist or antagonist can be used for the manufacture of a medicament for treating metabolic, proliferative or inflammatory condition.

N.B. The specification specifically claims the VDRR nucleic acid and polypeptide sequences given in figures 1, 4, 7 and 8, but no figures or are given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches 434;

The nucleic acid sequence was isolated from a human adult cDNA library using a swellfish ANO23 derived probe. The protein can be used for the development of drugs and diagnosis and treatment of various diseases.

The nucleic acid sequence was isolated from a human adult cDNA library using a swellfish ANO23 derived probe. The protein can be used for the development of drugs and diagnosis and treatment of various diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes the isolation of the novel human nuclear receptors nRR7 or nRR7-1. The nRR7 and nRR7-1 proteins are useful in the identification of downstream target genes and ligands regulating its activity. The nuclear receptor is involved in the regulation of in vivo cell proliferation and/or cell development. The nRR7 and nRR7-1 polynucleotides, expression vectors and host cells are useful for the recombinant production of the protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       멍
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ğ
                  This invention describes the isolation of the novel human nuclear receptors nR7 or nR7-1. The nR7 and nR7-1 proteins are useful in the identification of downstream target genes and ligands regulating its activity. The nuclear receptor is involved in the regulation of in vivo cell proliferation and/or cell development. The nR7 and nR7-1 polynucleotides, expression vectors and host cells are useful for the recombinant production of the protein.

                        The present sequence represents a human intranuclear receptor |
The nucleic acid sequence was isolated from a human adult cDNA
library using a swellfish ANO23 derived probe. The protein can
be used for the development of drugs and diagnosis and treatmen

The present sequence represents a human intranuclear receptor processes acid sequence was isolated from a human adult cDNA library using a swellfish ANO23 derived probe. The protein can be used for the development of drugs and diagnosis and treatment of various diseases.

The present sequence is a human vitamin D receptor related (VDRR) CC polypeptide. Human VDRR polypeptides and substances which affect VDRR CC signal transduction, can be used for treating metabolic, proliferative CC or inflammatory: conditions. They can be used in the manufacture of a CC medicament for treating the following conditions: obesity, diabetes, CC anorexia, lipoprotein defects, hyperlipidaemia, hyperchalestarolaemia or CC hyperlipoprotein defects, hyperlipidaemia, hypercholesterolaemia or CC milign tumours, hyperproliferative skin disorders or hyperthyroidism. CC Nucleic acid vectors encoding for expression of a VDRR polypeptide can CC with the can introducing them into a mammal. The introduced nucleic acid is then CC capable of transforming a cell in vivo and then polypeptide is expressed. A substance affecting VDRR signal transduction, such as an agonist or can be used for the manufacture of a medicament for treating metabolic, proliferative or inflammatory condition.

CC N.B. The specification specifically claims the VDRR nucleic acid and CC polypeptide sequences given in figures 1, 4, 7 and 8, but no figures are given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 19; Page 22-24; 35pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New vitamin D receptor related (VDRR) polypeptides, useful for treating obesity, diabetes, anorexia and rheumatoid arthritis

Human

steroid and xenobiotic receptor (SXR).

```
CC transcription through response elements present in steroid-inducible P450
CC genes, in response to a wide variety of natural and synthetic steroid
CC hormones and (iv) is prominently expressed in liver and intestine. SXR
CC regulates expression of catabolic enzymes, in response to many different
CC steroids, and thus affects metabolism. SXR is a broad specificity, low-
CC affinity receptor for reducing excessive levels of steroids in the
CC circulation. (Ant)sponists of SXR are used to regulate metabolism of
CC steroids particularly phytoestrogens or calcium-channel blockers, to
CC reduce steroid toxicity in subjects being treated with steroids, e.g. in
CC cases of tuberculosis (treated with rifampin and related compounds),
CC breast cancer (treated with tamoxifen, raloxifen etc.) or osteoporosis
CC (treated with Vitamin K), or to slow metabolism of therapeutic steroids.
CC (treated with Vitamin K), or to slow metabolism of therapeutic steroids.
CC (also, modulating endogenous SXR is used to treat disease, particularly
CC an agonist is used where endogenous steroid levels are excessive (e.g.
CC (cushing syndrome; virilism and hirsutism in women; polycystic ovarian
CC dehydrogenase deficiency, or breast, colorectal or prostatic cancer),
CC while antagonists are used where endogenous steroid levels are too low.
CC cells that express SXR are used to identify compounds likely to be
CC involved in undesirable drug interactions. Antibodies specific for SXR
CC expression density of SXR, also for diagnosis and therapeutically as
CC expression density of SXR, also for diagnosis and therapeutically as

The invention provides an isolated human nuclear receptor (designated pregnane X receptor, PXR) that binds to a cytochrome P-450 mono-oxygenase (CYP) promoter. The hPXR is used to identify: its specific modulators, and compounds that induce CYP3A4 expression (i.e. to identify drug interactions, since CYP3A4 is involved in many biotransformations of drugs). The modulators are potentially useful for: associating particular diseases and conditions with PXR and for treating such conditions.

The hPXR is used to identify: its specific modulators, and compounds that induce CYP3A4 expression (i.e. to identify drug interactions, since CYP3A4 is involved in many biotransformations of drugs). The modulators are potentially useful for: associating particular diseases and conditions with PXR and for treating such conditions. Antibodies raised against hPXR can be used for determination and purification of hPXR. The present sequence represents a histidine-6 tagged partial PXR (His6-PXR) sequence.
                                                                                                                    Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human pregnane X receptor, used to identify specific modulators agents that induce expression of cytochrome P-450 mono-oxygenase

It shows 73% identity in the DNA binding domain, and 42% identity in the ligand binding domain, to the human vitamin D receptor. Recombinant XOR-6 can be expressed in animal cells; a cDNA clone (T36499) coding for XOR-6 has been isolated. The recombinant XOR-6 may be used to regulate gene transcription or to raise antibodies of diagnostic

The present sequence represents rat VDR0. VDR1 differs from the canonical form of VDR (VDR0) by lacking the amino acid sequence encoded by exon 9, but instead substitutes a short sequence (GTEPGREELRDIGHYGDCE in the rat protein) encoded by the 5'-end of intron 8. VDR1 has a dominant negative effect on the vitamin D signalling pathway. The isoform protein can be used for determining bone density, and for the screening of compounds (e.g. steroids and retinoic acid derivatives) for vitamin D activity (e.g. as bone calcium regulators, immunosuppressants or anticancer agents).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gene for vitamin D receptor isoform protein which blocks vitamin D signal pathway - and production of recombinant isoform protein using it, for bone density assay and for screening compounds for vitamin D
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vitamin D receptor; VDR; bone density; retinoic acid derivative; steroid; bone calcium regulator; immunosuppressant; anticancer.

The isoform differs from the normal receptor (VDR0), which comprises the present sequence, in having the vitamin D response element curtailed by 86 residues, and having an extra 19 residues inserted at the C-terminal of this element. It acts as a dominant negative receptor in the vitamin D signal transmission channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rat; vitamin D receptor; isoform protein; VDR1; VDR0; diagnosis; dominant negative receptor; signal transmission channel; bone density disorder; screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A novel cDNA sequence encodes the rat vitamin D receptor isoform
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; Fig 1; 46pp; Japanese.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                   469.5

BINDS TO A RESPONSE ELEMENT IN CYP3A GENES PROMOTEI SUBUNIT: FORMS A HETERODIMER WITH RXR.
SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).
ALTERNATIVE PRODUCTS: 2 ISOFORMS; 1/PXR.1 (SHOWN HERE) AND 2/PXR.2; ARZ PRODUCED BY ALTERNATIVE SPLICING.
INDUCTION: ACTIVATED BY NATURALLY OCCURRING STEROIDS SUCH AS PREGNENOLONZ AND PROGESTERONE, SYNTHETIC GLUCCORTICOIDS AND ANTIGLUCCOCRTICOIDS AND 16-ALPHA-CARBONITRILE (PCN).
SIMILARITY: BELONGS TO THE NUCLEAR HORMONE RECEPTORS FAMILY.

-I FUNCTION: VDR MEDIATES THE ACTION OF VITAMIN D3 BY CONTROLLING THE EXPRESSION OF HORMONE SENSITIVE GENES.
-I SUBCELLULAR LOCATION: NUCLEAR.
-I ALTERNATIVE PRODUCTS: TWO FORMS (A AND B) ARE PRODUCED BY USE OF ALTERNATIVE INITIATION CODONS IN THE SAME READING FRAME.
-I DOMAIN: COMPOSED OF THREE DOMAINS: A MODULATING N-TERMINAL DOMAIN.
-I DOMAIN: COMPOSED OF THREE DOMAINS THE STROID-BINDING DOMAIN.
-I SIMILARITY: BELONGS TO THE NUCLEAR HORMONE RECEPTORS FAMILY.
